

DOMINO'S -
IMPROVING ORDER EXPERIENCE
UX CASE STUDY

Name of Project:
Domino's UX Case Study

Presented By:
Amrutha Vishnubhatla

Presented To:
CodeApha

PROJECT OVERVIEW

The Challenge

Ordering food should feel quick and effortless, but having many products, offers, and choices can sometimes make the experience harder to navigate.

My Goal

I explored how the Domino's ordering experience could be made more intuitive by reducing unnecessary decisions and making useful options easier to find.

My Focus

01 — Product Discovery

Helping users find something they actually want.

02 — Deal Discovery

Making better-value options easier to notice.

03 — Repeat Ordering

Making familiar orders quicker to place.

UNDERSTANDING THE USER JOURNEY

Existing Journey

Home → Browse Menu → Select Product → Customize → Cart → Checkout → Confirmation

While going through this journey, I identified three areas where the experience could be made smoother.

Key Pain Points

Decision Overload

Users may not always know what to choose when there are many products and combinations.

Offer Comparison

Finding the most suitable deal can require additional effort.

Repeat Ordering

Returning users may have to repeat steps when ordering something familiar.

These observations became the starting point for my redesign.

IMPROVEMENT -1 HELP ME CHOOSE

The Problem

When users open the menu without knowing exactly what they want, browsing through multiple categories can take time.

My Approach

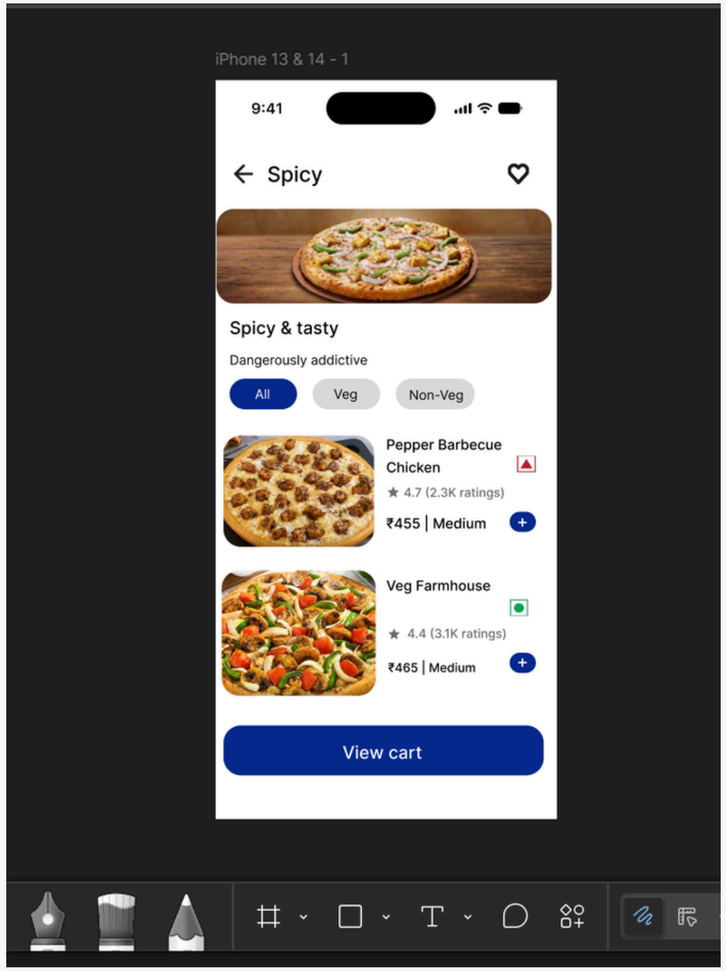

I introduced a “What are you craving?” experience that lets users start with their preference or mood instead of searching through the entire menu.

How It Works

Home → Select Mood → Relevant Recommendations → Product Details → Add to Cart

Why It Helps

The experience gives users a simpler starting point and reduces the effort involved in making a decision, while still allowing them to explore and choose freely.

IMPROVEMENT 2 - SMART DEAL ASSISTANT

The Problem

With multiple offers and combinations available, users may not immediately know whether their current cart is giving them the best value.

My Approach

I introduced a Smart Deal Assistant that checks the user's cart and highlights a relevant deal when a better-value option is available.

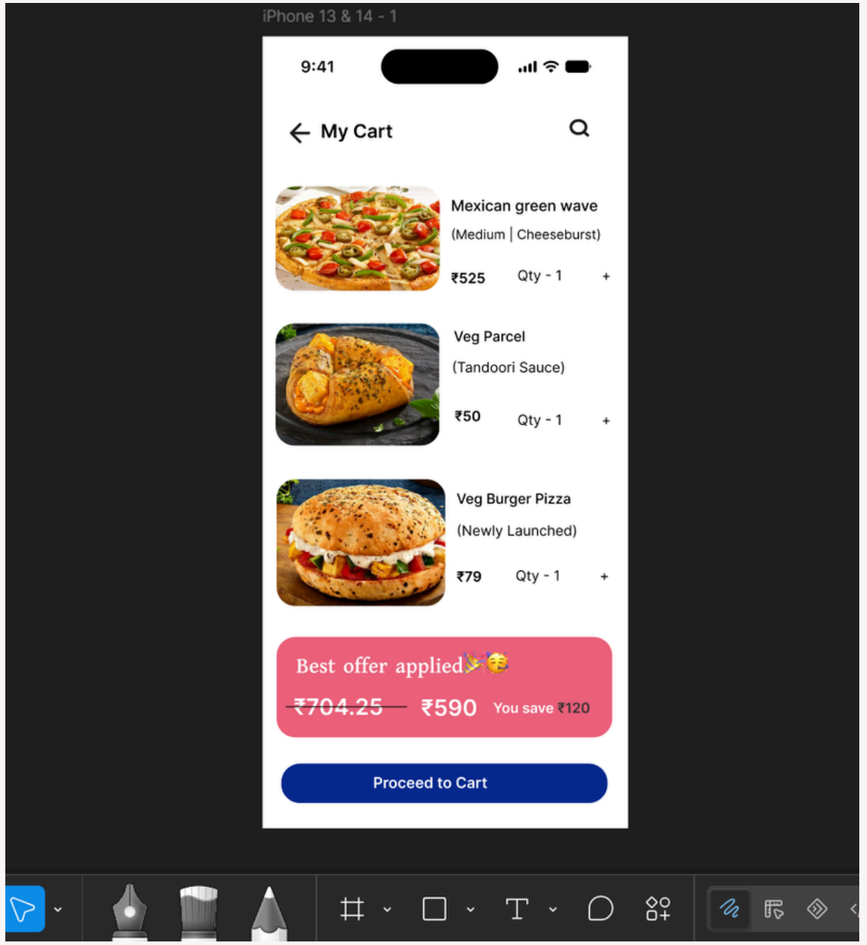

How It Works

Add Items → Open Cart → Identify Suitable Deal → Show Saving → Apply Deal → Checkout

Why It Helps

Instead of making users search for offers themselves, the most relevant information appears at the moment they need it — while reviewing their cart.

This makes the decision clearer and gives users more confidence before checkout.

IMPROVEMENT 3 - ONE TAP REORDER

The Problem

For users who frequently order the same food, going through the entire menu again can feel unnecessary.

My Approach

I introduced an “Order Again” section that brings previous orders directly into the user's journey.

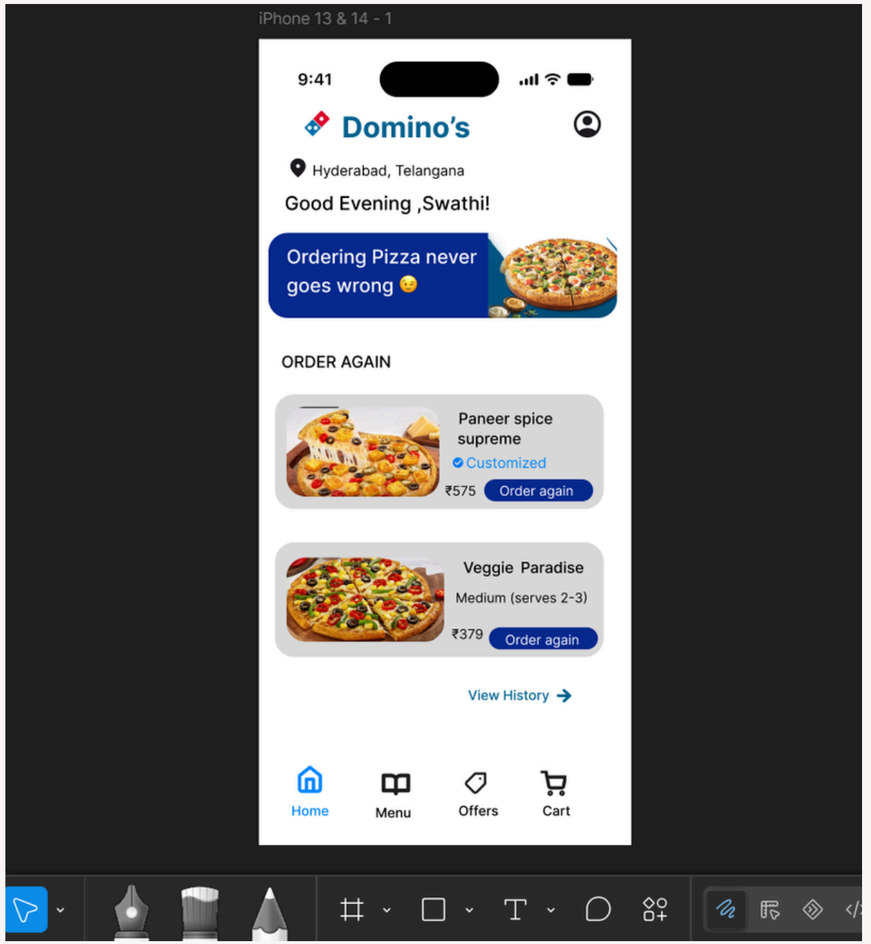

Users can select a previous order, review it, make changes if needed, and continue to checkout.

How It Works

Home → Order Again → Review Order → Edit if Needed → Checkout → Confirmation

Why It Helps

It removes unnecessary steps from repeat orders while keeping the user in control of what they finally purchase.

FINAL OUTCOME

Through these three improvements, I focused on making the ordering experience feel simpler, faster, and more user-friendly.

What I Improved

🍕 Easier Discovery

Help users find products based on what they are craving.

💡 Smarter Deal Discovery

Make relevant savings easier to notice.

🔄 Faster Repeat Ordering

Reduce unnecessary steps for returning users.

Design Approach

Reduce cognitive load → Reduce unnecessary interactions → Make useful information easier to find
